

COPY-ROASTING

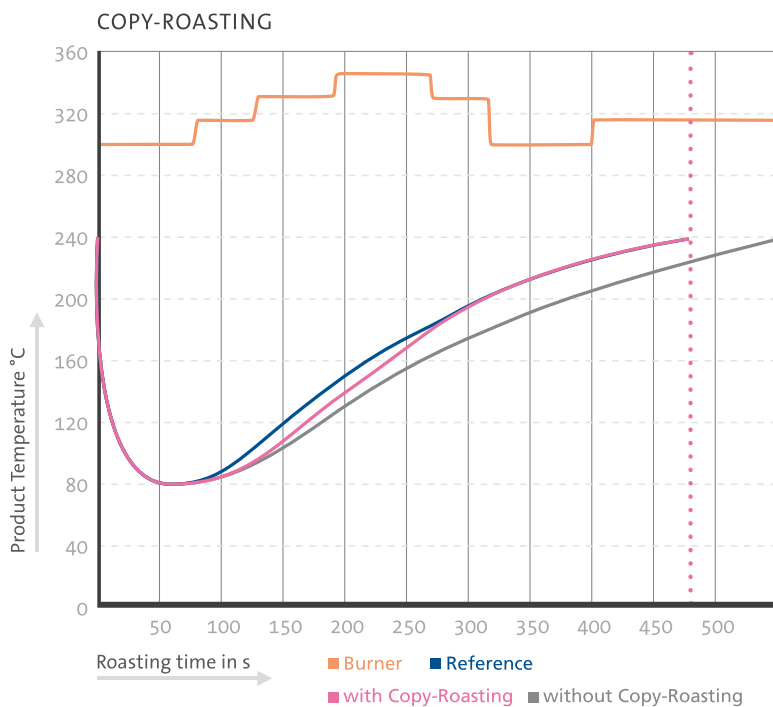

COPY-ROASTING

Each coffee bean is different! Even though species and region in which coffee is grown are the same, the beans may differ in moisture, storage time, temperature or bulk density. These differences will influence roasting and thus quality will vary. A modern roasting system should be able to compensate these product variations for constantly ensuring roasted coffee of the best possible quality.

For this reason Neuhaus Neotec on request equip each one of their roasting systems with a Copy-Roasting unit. For this purpose our engineers have designed an intelligent algorithm which will automatically detect deviations from the ideal roasting profile for compensating these by adjusting temperature and air quantity.

No matter what type of bean is being processed, Copy-Roasting by Neuhaus Neotec will always ensure the same product quality.

Neuhaus Neotec Copy-Roasting and Neuhaus Neotec Profile Roasting – your ideal team!

To give you an idea: Neuhaus Neotec Copy-Roasting

compensates all disturbing factors in green coffee
automatically corrects deviations from the ideal
roasting profile

can be used with all Neuhaus Neotec roasting systems
RFB-Roasters are best suited for this type of roasting
as the low heating capacity which is stored allowed
a quick adjustment of the heat quantity.

Even the warming-up process of the roasting plant
is adjusted by Copy-Roasting
