

Neuhaus Pad Coffee Grinder

Neuhaus Neotec has developed a highly flexible control system to provide constant, uniform grinding necessary for the production of capsule or pad coffee.

The new WMS-E roll grinder fulfills the most demanding product requirements, even under changing batches. The new model is optimized for medium grinding capacities with maximum grinding quality and constant capacity. Apart from the motor, each roller also has its own frequency converter. As a result, each roller can be driven at its own speed: The individual control of each roll regulates the speed individually, so that the fast and the slow side of the roll can be changed. Due to the flexibly adjustable grinding pressure (roll against product) an adjustment to the new product specifications is possible whenever changing the type of coffee. All parameters can be saved as a recipe for quick adjustment when changing the type. The grinder is available in two- or three-stage versions with an integrated compactor in a space-saving design.
